

HUMAISALI / HUMAISALI - PROFILE README TEARDOWN

ANIMATED GITHUB PROFILE

< My Exact Build, Step-by-Step />

The real prompts, files and fixes behind my live GitHub profile: a hero banner with a script-font name and a hologram photo reveal, a swinging ID badge, a floating About Me layout, a live tech-stack strip and GitHub Analytics — **built entirely with AI prompts, zero JavaScript.**

```
humais@github:~$ cat humaisali/README.md
```

What You'll Build

A GitHub profile README that plays like a mini movie the moment someone opens it — this is the exact page structure live at github.com/humaisali:

- **Animated hero banner** — your name popping in letter-by-letter as real vector outlines with a flowing gradient, cycling role titles, a typed tagline, and a code-editor card that types out a short personal reflection instead of code
- **Hologram photo reveal** — your photo materializes top-to-bottom on load behind a glowing scan line, then a scanner sweeps the banner forever, clipped to its rounded corners
- **Swinging ID badge** — a lanyard card with damped pendulum physics, your face in a glowing avatar ring, a barcode and a holographic shine sweep
- **Dark + light mode** — two banner versions that auto-switch with the viewer's GitHub theme
- **About Me spotlight** — your bio flows beside the swinging badge with zero visible tables, and the key terms are colored in your real brand accent
- **Tech Stack strip** — grouped skill-icon rows, no manual icon hunting
- **Live project cards** — pinned-repo cards that pull real stars/forks automatically instead of a static screenshot
- **GitHub Analytics** — a stats card, streak card and activity graph recolored to match the banner

What You Need

- A GitHub account (free)
- A clean photo or portrait of yourself — plain background works best
- An AI coding assistant that can generate SVG + Markdown (e.g. Claude) — for the animations and layout
- 20–25 minutes

Why SVG (and Math)?

GitHub strips **all JavaScript** from READMEs, and it also strips **inline CSS** (`style=`) and the old `<font>` tag. SVG + CSS/SMIL animations are the only thing that plays inside a README with zero libraries — and GitHub's built-in math renderer (KaTeX) turns out to be the one backdoor left for real colored inline text. Every trick in this guide works within those three walls.

1 Generate Your Character Photo

CHARACTER ART

Start with a clean photo or portrait of yourself — a real photo works just as well as illustrated art. Ask any AI image tool (ChatGPT / DALL-E, etc.) using the prompt below, or use a real photo you already have. A plain, uncluttered background is what matters: it's what makes background removal clean later.

AI IMAGE PROMPT (copy everything in the box)

A high-quality, photorealistic portrait of a young professional. [Describe yourself: hair, features, build]. Wearing a sharp [your outfit / brand color, e.g. royal blue business suit], confident relaxed pose, warm approachable smile, shot from the chest up, studio lighting. Plain or white background, sharp focus, high resolution.

Tip: generate a couple of variations and pick the one with the cleanest background and the clearest, most front-facing face — that face becomes your ID-badge avatar later, so it needs to read well cropped into a small circle.

2 Create Your Special Repository

ONE-TIME SETUP

- 1 Go to GitHub and create a new **public** repository
- 2 Name it **exactly** the same as your username (e.g. `humaisali/humaisali`) — this is GitHub's magic profile repo
- 3 Tick "Add a README file" and create it
- 4 You should see a hint: "You found a secret! This special repository..."

Note: everything you upload later — the SVGs and the README — goes straight into the root of this same repository. There's no separate hosting to set up.

Open your AI coding assistant, attach your photo, and paste the prompt below. Replace everything in [brackets] with your own details — and give it your **real** brand color instead of letting it guess one.

MASTER PROMPT — PART 1 (copy everything in the box)

I'm attaching my photo (clean background). Build me a complete animated GitHub profile banner and ID badge. My details: name [YOUR NAME], role [YOUR ROLE], GitHub username [USERNAME], tagline [YOUR TAGLINE], accent color [YOUR HEX COLOR]. Deliver these files:

1. banner.svg — a dark animated SVG (about 1280x740) in my accent color: my name in a script font converted to vector outlines (so it renders identically everywhere, not just fonts installed on the viewer's machine) with an animated gradient, letters popping in one by one; cycling typed role titles with a blinking cursor; a typed quote box with my tagline; a code-editor card titled '[FILENAME].jsx' that types out a short personal reflection line-by-line instead of code — a few short lines with blank lines between thought-groups for pacing; a neon sign that flickers on saying '[YOUR MOTTO]'; moving stars that drift and spin across the banner, twinkling sparkles, rising particles, and pulsing ambient orbs behind everything. Remove my photo's background and embed it as base64 PNG (not WebP — old Safari). Reveal my photo with a one-time top-to-bottom hologram formation led by a glowing scan line, then run a continuous full-width horizontal scanner sweeping top to bottom every 3.5s, clipped to the banner's rounded corners. Make every typing reveal window much taller than the text so no OS font ever clips letters.

2. banner-light.svg — the same banner recolored to blend into a white page, and wire the README with a <picture> prefers-color-scheme tag so dark/light mode auto-switch.

3. lanyard.svg — a swinging ID badge in pure SVG: strap with printed text in my accent color, metal clasp and ring, dark glass card with my face cropped from my photo inside a glowing avatar ring, my name, role, handle, a barcode, and a holographic shine sweep. Drop in from the top, swing with damped pendulum physics, then sway gently forever.

Rules: use only SMIL + CSS animations (GitHub strips JavaScript), and add ?v=1 cache-busting query parameters to every local image reference.

4 Build the Rest of the Page

ABOUT • TECH STACK • PROJECTS • ANALYTICS

Once the banner and badge exist, paste this second prompt in the **same conversation** so the assistant keeps your file names and colors consistent.

MASTER PROMPT – PART 2 (copy everything in the box)

Now extend my README below the banner with these sections, each separated by a horizontal rule:

1. Contact links – centered Portfolio / LinkedIn / Email badges (shields.io, flat-square style, my accent color) that open in a new tab.
2. About Me – my ID badge SVG floating beside my bio using an HTML `img align` attribute, with the text wrapping naturally around it (GitHub strips `style=` and `flexbox`, so this is the only reliable way to get a two-column feel without a visible table). Bold the key terms in my bio and color them in my accent hex using `$\textcolor{HEX}{\textbf{\textsf{...}}}$` – GitHub renders this through its built-in math support, and it's currently the only way to get real colored inline text.
3. Tech Stack & Tools – a borderless three-column table (`border="0"`) using `skillicons.dev` icon rows, grouped as Frontend / Backend / Ecosystem.
4. Top Featured Projects – a borderless table of pinned-repo cards for [YOUR REPO NAMES], pulled live from a GitHub stats-card generator's `/api/pin` endpoint so stars and forks update automatically instead of being a static screenshot.
5. GitHub Analytics – a centered stats card, streak card, and full-width activity graph from a GitHub stats-card generator, all recolored to match my banner's accent and background colors.

Rules: no table borders showing anywhere (`border="0"`, `cellspacing="0"`, `cellpadding="0"`), no `<style>` or `<font>` tags since GitHub strips them, and add `?v=1` to my local image references.

Real lesson from building this: a floating image (`align="right"`) flows text around it with zero dead space, but a fixed-width table gives two even columns. Pick based on whether your text and your image end up close in height — if one is much taller than the other, float it instead of tabling it.

5 Upload Everything

GO LIVE

- 1 In your `username/username` repo, click **Add file > Upload files**
- 2 Upload `banner.svg`, `banner-light.svg`, `lanyard.svg` and `README.md` to the repository root
- 3 Commit — your profile updates instantly

Step 6 — The Cache Trick (Important!)

GitHub caches README images hard. If you ever edit an SVG and “nothing changes,” the file is fine — the cache is stale. Fix: in `README.md`, bump the version query on that image, e.g. `banner.svg?v=1` to `?v=2`. New URL = instant fresh fetch. Best practice: commit the SVG first, then commit the README with the bumped number.

Pro Tips

- GitHub strips `<style>`, `<font>` and JavaScript completely — `align="right"` floats, borderless tables (`border="0"`), and the `$_{color-{}$}` math trick are your entire toolkit for layout and color.
- If a stats/streak/graph card renders with an invisible background even after setting `bg_color`, try adding `hide_border=false` plus an explicit `border_color` — some card services only paint the fill when a border is also being drawn.
- Ask the AI to tweak anything after the first draft — scanner speed, colors, new sections. Iterate freely instead of starting over.
- Test both GitHub themes (Settings > Appearance > light / dark) since your two banners are separate files.
- Verify your real profile links, repo names and brand colors before generating — don’t let the AI guess them.

That's it — your profile is now alive.
If this guide helped, share it forward. Keep coding, keep growing.
